

ADVANTAGES:

- **Smooth Baggage Transfer**
- **High Speed Capacity**
- **Low Noise**
- **Low Maintenance**
- **Rugged Construction**
- **Product Orientation**

OVERVIEW:

Power turn conveyors transfer baggage smoothly and efficiently around curves without changing or affecting the orientation of the baggage relative to the conveying surface. Positioned adjacent to other conveyors, they accommodate baggage flow by providing a gentle, effective change in baggage direction.

Available for all standard widths, power turns are manufactured in angular increments from 15° to 209°.

G&S Airport Conveyor utilizes both Portec Sigma® Belt power turns and Transnorm System Inc. power turns.

DRIVE

G&S Airport Conveyor drives all Sigma® Belt power turns using integral motor / gearbox reducers; optional drive methods are available.

INSTALLATION

G&S Airport Conveyor site representatives have extensive installation experience using power turn conveyors, and are experts at installing and maintaining this equipment.
